## Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims in the application.

## Listing of Claims:

- 1. (previously presented) A bag comprising a sheet of flexible, foldable material,
  - (a) wherein the sheet is coated with a metal to define a metal treated side and an untreated side;

1 1:

- (b) the sheet being folded along a longitudinal fold line with the treated side facing outwardly and the untreated side facing inwardly, and the fold line being in-folded into the bag, thus defining a gusset centered along the fold line with at least two gusseted bottom edges;
- (c) transversely opposite side edges wherein the sheet is bonded together extending substantially perpendicular to the fold line; and
- (d) end portions of the gusseted bottom edges comprising angled edges wherein the sheet is bonded together extending from each gusseted bottom edge to the side edges at a predetermined angle relative to the gusseted bottom edge.
- 2. (original) The bag according to claim 1, wherein the predetermined angle is between 30-60 degrees.
- 3. (previously presented) The bag according to claim 2, wherein the predetermined angle is about 45 degrees.
- 4. (original) The bag according to claim 1, wherein the angled edges end where a side edge meets the fold line.
- 5. (original) The bag according to claim 1, wherein apertures are provided proximal to a top edge of the bag.
- 6. (original) The bag according to claim 1, wherein the sheet is folded to also define an exposed portion proximal to a top edge of the bag.

- 7. (original) The bag according to claim 1, wherein the flexible foldable material is a thermoplastic.
- 8. (original) The bag according to claim 1, wherein the sheet is coated with aluminum.
- 9. (withdrawn) A method for manufacturing a bag using a sheet of flexible, foldable material comprising the steps of:
  - (a) coating one side of the sheet with metal defining a treated side and an un-treated side;
  - (b) folding the sheet along a fold line such that the treated side faces outwards;
  - (c) creating a gusset centered along the fold line by in-folding at the fold line, thus defining gusseted bottom edges and a gusset depth in a direction substantially perpendicular to the fold line;
  - (d) making "V" shaped cuts through the gusset, at predetermined intervals in a direction parallel to the fold line, such that the corner of the "V" shape is positioned at a pre-determined length from the gusseted bottom edge and the sides of the "V" shape extends towards and end at the gusseted bottom edges;
  - (e) bonding the sheet together at adjacent edges cut in step (d) that have un-treated sides facing each other;
  - (f) cutting along a line starting at said corner of each "V" shaped cut and extending in a direction substantially perpendicular to the fold line and ending at a top edge of the bag; and
  - (g) bonding the sheet together at adjacent edges cut in step (f).
- 10. (withdrawn) The method according to claim 9, wherein steps (d) and (e) are performed simultaneously.
- 11. (withdrawn) The method according to claim 9, wherein steps (f) and (g) are performed simultaneously.
- 12. (withdrawn) The method according to claim 9, wherein steps (d), (e), (f) and (g) are performed simultaneously.

- 13. (withdrawn) The method according to claim 9, wherein the "V" shape forms about a ninety degree angle.
- 14. (withdrawn) The method according to claim 9, wherein the tip of the "V" shape is positioned a gusset depth's length from the gusseted bottom edges.
- 15. (withdrawn) The method according to claim 9, wherein the flexible foldable material is a thermoplastic.
- 16. (withdrawn) The method according to claim 9, wherein the sheet is coated with aluminum.
- 17. (cancelled)
- 18. (withdrawn) A machine for simultaneously making a cut and sealing resulting edges on a sheet of flexible material comprising:
  - (a) a heated block;
  - (b) a blade, disposed to produce "V" shaped cuts, coupled to and extending outwards from a top surface of the heated block;
  - (c) a lower plate (i) disposed over the heated block, (ii) provided with a hole the shape of and slightly larger than the blade and disposed to receive the blade, and (iii) spring loaded for motion in a direction perpendicular to the top surface of the heated block;
  - (d) an upper plate (i) disposed over the lower plate, (ii) capable of motion in a direction perpendicular to the top surface of the heated block, to press on the lower plate such that the blade passes through the hole and contacts the upper plate.
- 19. (withdrawn) The apparatus according to claim 18, wherein the heated block comprises separable cast metal layers machined to hold a replaceable heating means.
- 20. (withdrawn) The apparatus according to claim 18, wherein the lower plate comprises a metal stripper plate and an insulating plate attached to a top surface of the stripper plate.
- 21. (withdrawn) The apparatus according to claim 18, wherein the upper plate comprises a metal clamp plate and a resilient surface on an underside of the clamp plate.

Application No. 10/649,831 Amendment dated October 13, 2005 Annotated Sheet Showing Changes

- 22. (withdrawn) The apparatus according to claim 18, wherein the blade is disposed to produce "Y" shaped cuts.
- 23. (withdrawn) The apparatus according to claim 18, wherein the flexible material is a thermoplastic.
- 24. (withdrawn) The apparatus according to claim 18, wherein the upper plate is pneumatically driven in a direction perpendicular to the top surface of the heated block.
- 25. The bag according to claim 1, wherein the metal-treated side is entirely coated with metal.
